

Sprint 4

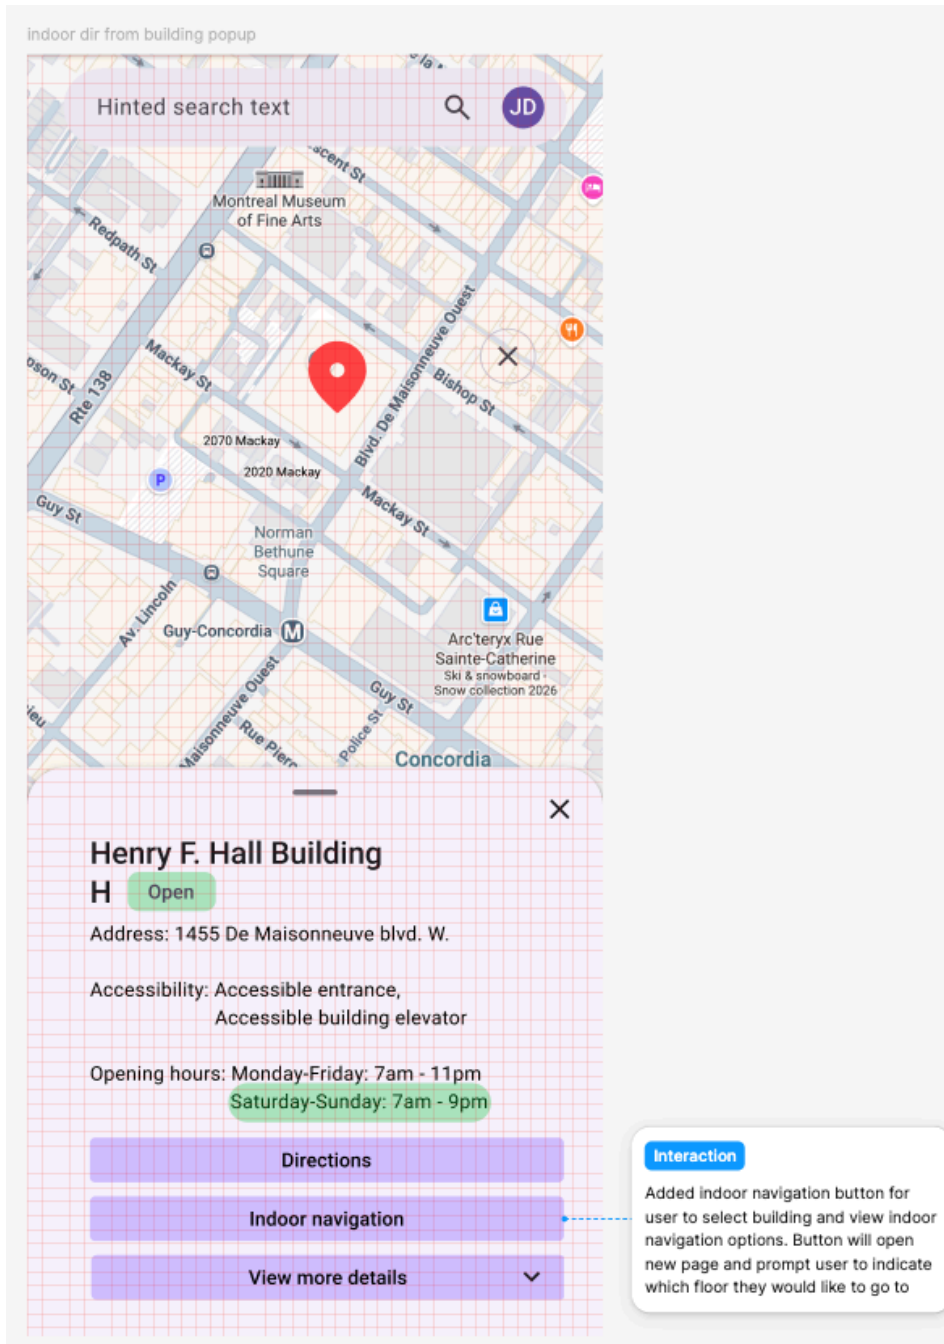

US-5.1 - View an indoor floor map for a building

US-5.2 - Locate and select rooms on an indoor map (start and destination)

US-5.3 - Show the shortest indoor path on the same floor

Usability: The indoor map view is usable without crashing and supports basic interactions (zoom/pan if implemented).

Given a building that supports indoor maps, when the user selects the building, then the app displays the available floors.

When the user selects a floor and start/end destination, then the indoor floor map for that floor is displayed.

select floor

Building selected is clearly indicated

Floor selection is clearly being made

This is pre-selected as the user has to choose which building in the previous screen

Prompts user to select a floor

Choice of a dropdown to ensure no user error

User has to select a floor before proceeding

User has to choose end destination building if applicable

User needs to pick end destination floor for the destination building. If previous input box is empty, then assume destination building is the same as start destination building

Progress bar is shown to show user progression

POI

- The user can switch floors and edit start/end destinations, and the displayed map updates accordingly.
- Given Start and Destination are selected on the same floor, when the user requests directions, then the app displays the computed shortest path on the indoor map.

- Have a set of steps for user to confirm where they are in indoor directions

If a building has no indoor map support, the app clearly indicates “Indoor map not available for this building.”
