

US-5.4 - Provide accessible indoor routing (disability-friendly)

Given Start and Destination are selected, when the user enables “Accessible route”, then the generated path avoids stairs when an elevator/accessible alternative exists in the map data.

Example: escalator route

Example 2: elevator route

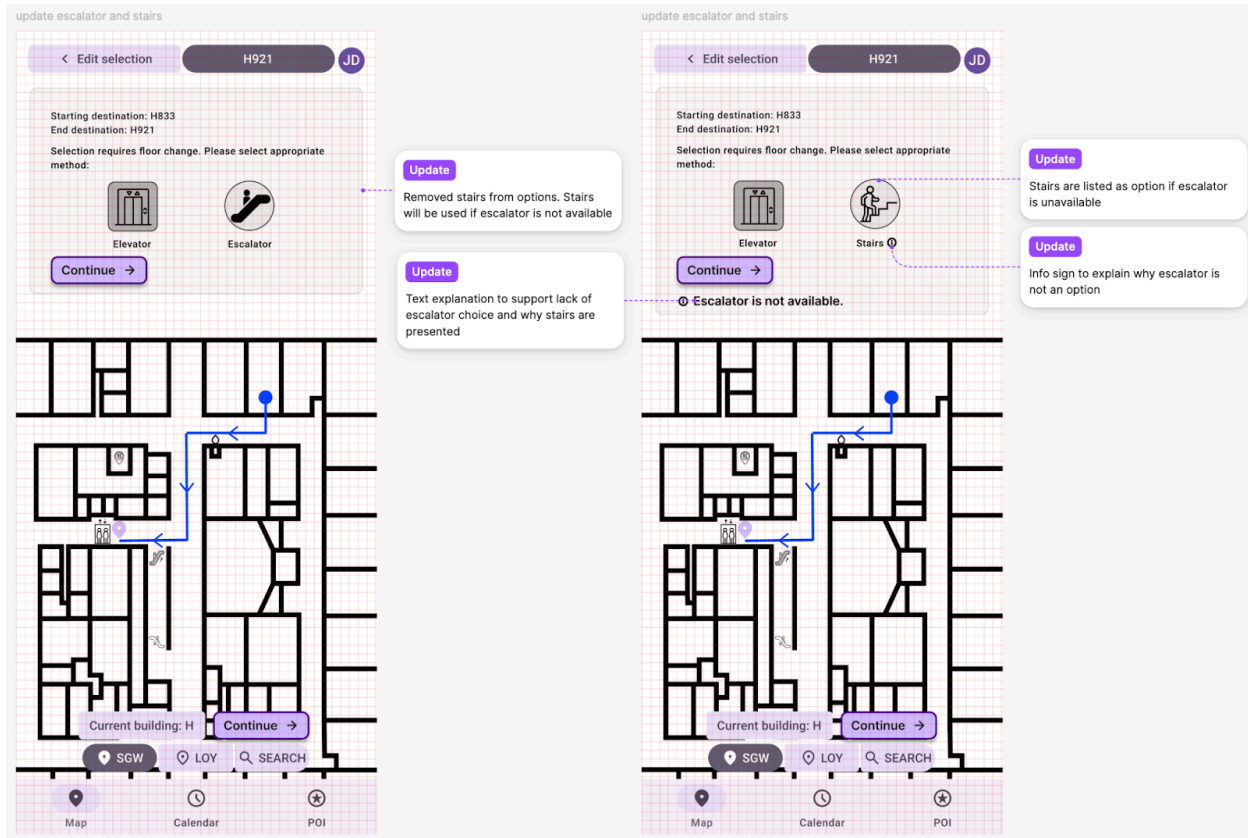

If an accessible route is not possible, the app clearly indicates “Accessible route not available” and may offer the non-accessible route as an alternative.

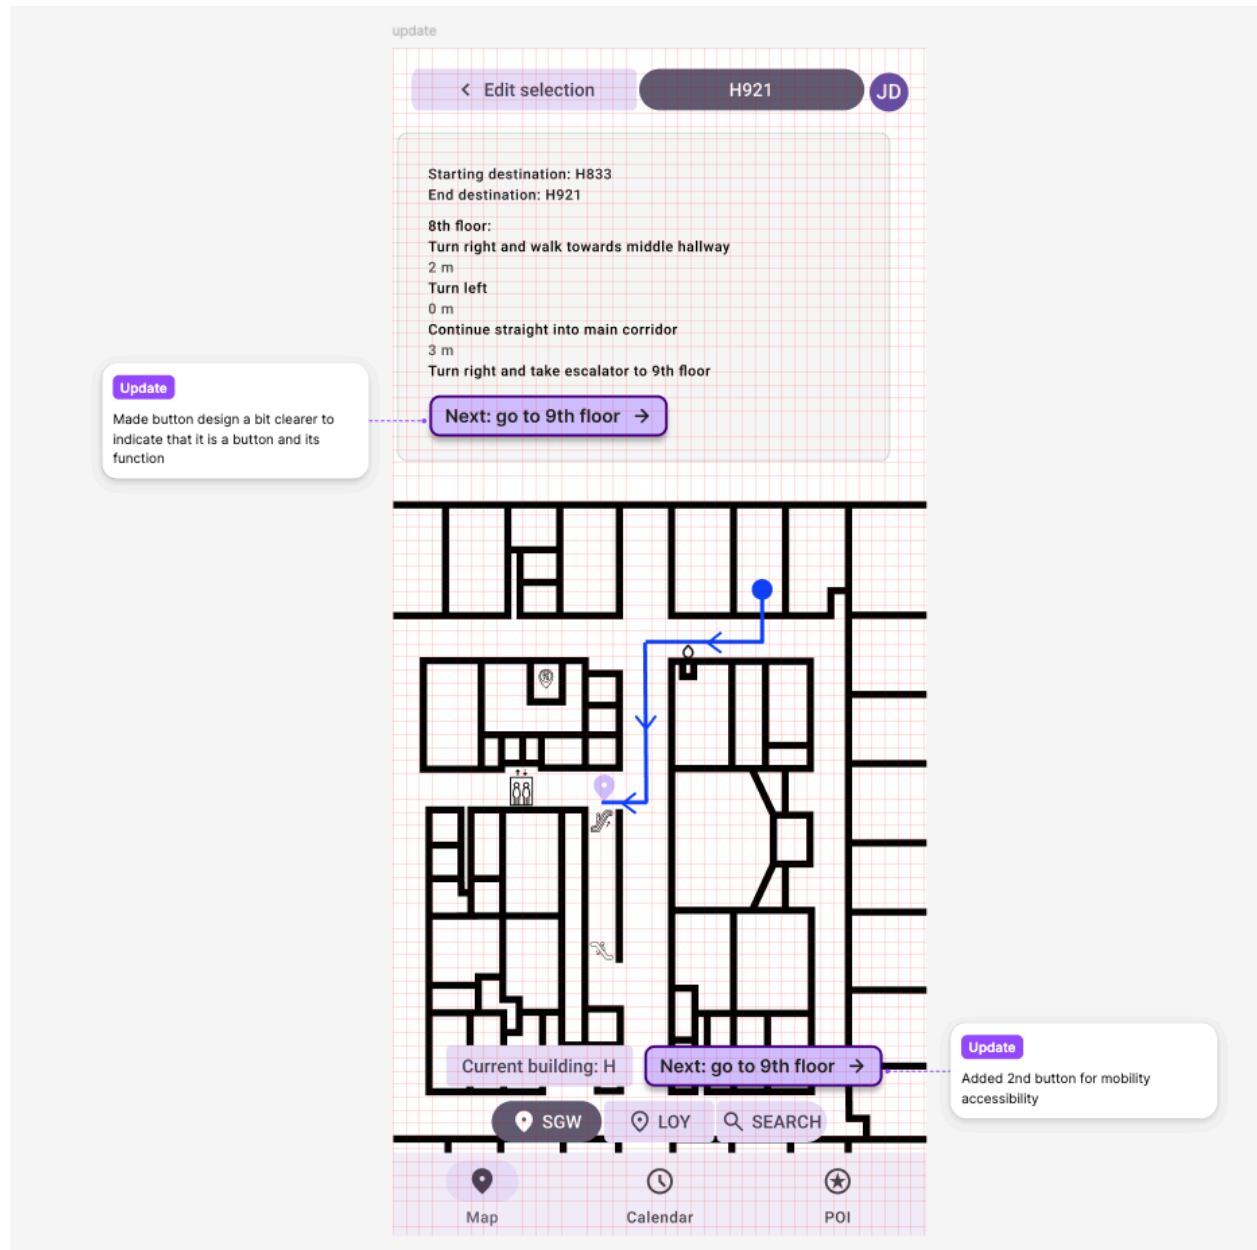

UPDATE after PO meeting:

- Stairs is not a necessary option
- Suggestion: Merge it with the escalator option. Escalators will be the default and if not available then use stairs.

UPDATE after PO meeting:

- Add an accessibility button to go to next set of directions so the button '9th floor →'
- Suggestion: Add it to the right of 'Current building' tag for mobility accessibility
- Make the button design more obvious to clearly show that it is a button

Keep design consistent across all screens:
